Forward Deployed Engineer, Sim, San Francisco

Hi Sim team,

First off, I admire your product. The thing that got me was the little “On error” branches in the workflow on your homepage. Enrich a lead, hand it to an agent, post it to Slack, and there’s a way out when a step fails. Usually demos just show everything working, so it was nice to see someone thinking about what happens when it doesn’t.

I kind of built a small version of this at Cybership. It’s an automation rules engine, like Shopify Flow, with triggers, conditions and actions, and it runs 50,000+ times a day now. Yours has an agent in the middle doing the thinking instead of fixed rules, and that’s the part I really want to learn next.

I also care a lot about what happens when things fail halfway. I built our packing-station desktop app, and I designed it so that if it crashes in the middle of a print job, it never prints the same label twice. Agents working on real company systems need that same kind of safety, and it’s something I’ve already built.

And honestly the customer side is my favourite part. When a warehouse is stuck I’m usually the one on the call, and I stay on it till it’s fixed and the fix is in the product. Doing that every day, with the founders, from the first call to production, sounds like the fun part to me.

I’m in India right now, I’d need the visa sponsorship you mentioned, and I’m happy to move to SF and be in the office.

Thanks for reading,
Anurag
